

Unit 10

Groups

Rubik's Cube

❑ What will happen if $RUR'U'$ is repeatedly applied?

○ (0.5 min)

<https://www.youtube.com/watch?v=8zrkS0fzZDk>

❑ How about UL?

Outline of Unit 10

- ❑ 10.1 What is Modern Algebra?
- ❑ 10.2 Groups
- ❑ 10.3 Groups of Symmetry
- ❑ 10.4 Rubik's Cube

Unit 10.1

What is Modern Algebra?

The Origin of “Algebra”

- ❑ “Algebra” is derived from the Arabic word “al-jabr”.
 - First used by the Persian mathematician, Muhammad Al Khwarizmi, in the title of his mathematics book.
 - It roughly means “reunion”, which describes the method for collecting terms of an equation in order to solve it.

Muhammad Al Khwarizmi (780-850), the Father of Algebra.

Algebra = Solving Equations

Classical Age of Algebra

- ❑ Methods to solve linear and quadratic equations were known in ancient times.
 - $ax + b = 0$
 - $ax^2 + bx + c = 0$
- ❑ Cubic and quartic equations were solved in the 16th century.
 - $x^3 + ax^2 + bx + c = 0$
 - $x^4 + ax^3 + bx^2 + cx + d = 0$

How about *quintic* equation?

Degree	Name
0	Constant
1	Linear
2	Quadratic
3	Cubic
4	Quartic
5	Quintic
6	Sextic or Hexic
7	Septic or Heptic
8	Octic
9	Nonic
10	Decic

Modern Age of Algebra

Niels Henrik Abel (1802-1829),
a Norwegian mathematician.

- In 1824, **Abel** showed that there does not exist any formula for the roots of an equation whose degree is 5 or above.

Évariste Galois (1811-1832), a
French mathematician.

- Later, **Galois** laid the foundation for a branch of mathematics known as group theory.
 - Watch this if you're interested:
 - <https://www.youtube.com/watch?v=Mc0bvea6G3I> (3.5 min)

What is Modern Algebra?

- ❑ Modern algebra is also called abstract algebra.

Algebra = Study of Algebraic Structures

- ❑ Examples of algebraic structures:
 - groups, rings, fields, vector spaces, modules, etc.
- ❑ Watch the 3-min video:
 - https://www.youtube.com/watch?v=IP7nW_hKB7I&list=PLi01XoE8jYoi3SgnnGorR_XOW3IcK-TP6

Abstract algebra will challenge you like never before.

Algebraic Structures

- ❑ An algebra consists of
 - i. a set of elements, and
 - ii. one or more operations on the set.
- ❑ Operation: a way of combining two elements of the set to produce an element of the same set.
- ❑ Example: The set of integers with addition.

Identity and Inverse

□ Consider a set S and an operation $*$.

□ Definition:

○ An element $e \in S$ is called the **identity** if

$$x * e = e * x = x \text{ for all } x \in S.$$

○ An element $y \in S$ is called the **inverse** of x if

$$x * y = y * x = e.$$

□ Example: The set of integers with addition.

a) Identity?

b) Inverse of 1?

Example: Boolean Algebra for Sets

Set Union

- ❑ Commutative
 - $A \cup B = B \cup A$
- ❑ The empty set \emptyset is the identity element for \cup
 - $A \cup \emptyset = A$
- ❑ No inverse

❑ Distributive

- $A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$
- $A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$

❑ And many other rules...

Set Intersection

- ❑ Commutative
 - $A \cap B = B \cap A$
- ❑ The universal set U is the identity element for \cap .
 - $A \cap U = A$
- ❑ No inverse

Example: Matrix Algebra

Addition

- ❑ Matrices can be added
 - $A + B$ is also a matrix.
- ❑ **Commutative**
 - $A + B = B + A$.
- ❑ Zero matrix
 - $A + 0 = A$.
- ❑ Additive inverse exists (so subtraction can be performed).
 - $A + C = 0$ (C always exists)

Multiplication

- ❑ Matrices can be multiplied
 - AB is also a matrix.
- ❑ **Non-commutative**
 - $AB \neq BA$ (in general)
- ❑ Identity matrix
 - $AI = A$
- ❑ Multiplicative inverse may or may not exist.
 - $AC = I$ (C may or may not exist)

Algebraic Structures

Structure s	Operations (that satisfy certain properties)	Examples
Group	Addition & Subtraction	24-Hour Clock ($16:00 + 1:50 = ?$)
Ring	Addition, Subtraction, & Multiplication	Integers, Modulo q (where q is a composite number).
Field	Addition, Subtraction, Multiplication & Division (except 0)	Rational Numbers, Real Numbers, Complex Numbers, Modulo p (where p is prime).
Vector Space	Scalar Multiplication & Division (except 0), Vector Addition & Subtraction	Real vector space, complex vector space, binary vector space.

□ We consider only groups in this unit.

Unit 10.2

What is a Group?

The Definition of Groups

- A set of elements, G , with an operation (denoted by $*$)
 - We denote it by $\langle G, * \rangle$.
- 1. **Closure** under $*$
 - $x, y \in G \Rightarrow x * y \in G$
- 2. There exists an **identity** element $e \in G$
 - $y * e = e * y = y$, for all $y \in G$
- 3. **Inverse** $x^{-1} \in G$ exists for all $x \in G$
 - $x * x^{-1} = x^{-1} * x = e$
- 4. **Associativity** of $*$
 - $(a * b) * c = a * (b * c)$

Definition of Groups: (3 min):

https://www.youtube.com/watch?v=QudbrUcVPxk&list=PLi01XoE8jYoi3SgnnGorR_XOW3IcK-TP6&index=2

Abelian Groups

- ❑ In the definition of groups, the operation is *not* required to be *commutative*.
 - That is, $x * y$ is not required to be equal to $y * x$.
 - Note: identity and inverse are defined for both sides.
- ❑ If the commutative rule applies, then the group is called a *commutative* group or an *Abelian* group.

Classwork: The Set of Integers

a) Is $\langle \mathbb{Z}, + \rangle$ a group?

☐ Closure

☐ Inverse

☐ Identity

☐ Associativity

b) Is $\langle \mathbb{Z}, \times \rangle$ a group?

☐ Closure

☐ Inverse

☐ Identity

☐ Associativity

Example: Addition Modulo n

- ❑ For illustration, suppose $n = 4$.
- ❑ $G = \{0, 1, 2, 3\}$ with addition mod 4
 - Closed under $+$
 - For any $x, y \in G$, $x + y \pmod{4} \in G$
 - Identity element: 0
 - For any $x \in G$, $0 + x = x + 0 = x$.
 - Inverse exists.
 - For any $x \in G$, $x^{-1} = 4 - x$.
 - Associativity:
 - $(x + y) + z \pmod{4} = x + (y + z) \pmod{4}$.
- ❑ We denote the *additive group of integers mod n* by \mathbb{Z}_n .
 - (In some books, it was written as $\mathbb{Z}/n\mathbb{Z}$.)

+	0	1	2	3
0	0	1	2	3
1	1	2	3	0
2	2	3	0	1
3	3	0	1	2

Classwork: The Empty Set

c) Can the empty set form a group?

☐ Closure

☐ Inverse

☐ Identity

☐ Associativity

Uniqueness of Identity and Inverse

- There is only one single identity element in G .
 - Suppose e_1 and e_2 are both identity elements.
 - Since e_1 is an identity, $e_1 * e_2 = e_2$.
 - Since e_2 is an identity, $e_1 * e_2 = e_1$.
 - Hence, $e_1 = e_2$.
- For each $x \in G$, there is only one single $x^{-1} \in G$.
 - Suppose y_1 and y_2 are both inverses of x .
 - $y_1 * (x * y_2) = y_1 * e = y_1$
 - $(y_1 * x) * y_2 = e * y_2 = y_2$
 - Since $*$ is associative, $y_1 * (x * y_2) = (y_1 * x) * y_2$.
 - Hence, $y_1 = y_2$.

Notation

- There are two common ways to denote the operator $*$ and the identity element e :

Addition: $+$
Identity: 0

Multiplication: \times
Identity: 1

$a \times b$ is often simplified as ab .

$a^n = a \times a \dots \times a$. (n times)

$a^0 = 1$ (or denoted by e)

Order (two different senses)

- The *order* of a *group* G , denoted by $|G|$, is the number of elements in G .
 - Just like the cardinality of a set.
- The *order* of an *element* $x \in G$, denoted by $|x|$ or $\text{ord}(x)$, is the smallest positive integer n such that $x^n = e$.
 - It represents how long it takes *to reach the identity*.
- If there is no such n , then the order of x is infinity.

Classwork

□ Consider the set of **non-zero real numbers** with **multiplication**.

a) Is it a group? Why is zero excluded?

☐ Closure

☐ Identity

☐ Inverse

☐ Associativity

b) What are the orders of the elements of this set?

Cayley Table

The identity e is usually put in the first entry.

□ Cayley table is also called group multiplication table.

- You have seen one in a previous example.

$*$	e		y	
e				
x			$x * y$	

□ Just like how you learnt multiplication in the primary school.

Multiplication Table 1 x 10

x	1	2	3	4	5	6	7	8	9	10
1	1	2	3	4	5	6	7	8	9	10
2	2	4	6	8	10	12	14	16	18	20
3	3	6	9	12	15	18	21	24	27	30
4	4	8	12	16	20	24	28	32	36	40
5	5	10	15	20	25	30	35	40	45	50
6	6	12	18	24	30	36	42	48	54	60
7	7	14	21	28	35	42	49	56	63	70
8	8	16	24	32	40	48	56	64	72	80
9	9	18	27	36	45	54	63	72	81	90
10	10	20	30	40	50	60	70	80	90	100

Copyright © 2020 Math, Kids and Games

Example: $\{1, -1, i, -i\}$ with \times

\times	1	-1	<i>i</i>	<i>-i</i>
1	1	-1	<i>i</i>	<i>-i</i>
-1	-1	1	<i>-i</i>	<i>i</i>
<i>i</i>	<i>i</i>	<i>-i</i>	-1	1
<i>-i</i>	<i>-i</i>	<i>i</i>	1	-1

- ❑ The table is *symmetric* across the diagonal...
 - ...because this group is **Abelian**, i.e., $a \times b = b \times a$.
- ❑ No *duplicate* elements in every row and column.
 - Why? Watch this (7.5 min):
 - https://www.youtube.com/watch?v=BwHspSCXFNM&index=9&list=PLi01XoE8jYoi3SgnnGorR_XOW3IcK-TP6

Groups of Orders 1, 2 and 3

$*$	e
e	e

Group of order 1, the trivial group.

$*$	e	a
e	e	a
a	a	e

Group of order 2, \mathbb{Z}_2 .

$*$	e	a	b
e	e	a	b
a	a	b	e
b	b	e	a

Group of order 3, \mathbb{Z}_3 .

□ Filling in Cayley table is kind of like **solving Sudoku puzzle**.

- Each row and each column must contain all the elements of the group.

Subgroups

- ❑ Consider $\langle G, * \rangle$, $H \subseteq G$, and $H \neq \emptyset$.
- ❑ If $\langle H, * \rangle$ is a group, then H is a subgroup of G , denoted by $H \leq G$.
- ❑ Two standard subgroups:
 - The group itself: $\langle G, * \rangle$
 - Trivial subgroup: $\langle \{e\}, * \rangle$
- ❑ Example:
 - The set of integers with addition is a group.
 - The set of even numbers with addition is its subgroup.

Classwork

- a) $\langle \mathbb{R}, + \rangle$ is a group. Is $\langle \mathbb{Z}, + \rangle$ its subgroup?
- b) $\langle \mathbb{R} \setminus \{0\}, \times \rangle$ is a group. Is $\langle \mathbb{Z} \setminus \{0\}, \times \rangle$ its subgroup?

Unit 10.3

Groups of Symmetry

Groups of Symmetry for Rectangles

identity
 e

rotate 180°
 r

flip
 f

flip & then rotate
 rf

- The four **group elements** e, r, f, rf are **geometric transformations**, which are functions.
 - They map the corner labels (1, 2, 3, 4) to different positions.
 - Note that rf is equal to fr .
- The **group operation** is **function composition**.

Groups of Symmetry for Rectangles

□ Multiplication Table:

\circ	e	r	f	rf
e	e	r	f	rf
r	r	e	rf	f
f	f	rf	e	r
rf	rf	f	r	e

Groups of Symmetry for Triangles

There are six group elements e , r , r^2 , f , rf , r^2f .

Watch it if you want to know more: (4 min)

<https://www.youtube.com/watch?v=DeCcqiogLY>

- Are there other symmetries not shown above?
 - No, since there are **three** possible positions for 1. After 1 is fixed, there are **two** possible positions (either left or right of 1) for 2. Total number of combinations is $3 \times 2 = 6$.
- Is it an Abelian group?

Unit 10.4

Rubik's Cube

Rubik's Cube

- ❑ A 3-D combination puzzle invented in 1974.
- ❑ Highly popular in the 1980's.
- ❑ Widely considered the world's best-selling toy.
- ❑ Can you see that a group can be defined on it?

Notation

□ Six basic moves:

- Right (R), Left (L)
- Front (F), Back (B)
- Up (U), Down (D)

□ A **move** is any *sequence* of these six basic moves.

- e.g. RU, RRR, etc.
- ## □ Two moves are considered the same if they result in the same configuration of the cube.
- e.g., RRRRRR is the same as R (why?)

Rubik's Cube as a Group $\langle G, * \rangle$

□ G : the set of all possible moves.

○ $|G| = 43,252,003,274,489,856,000 = 2^{27} 3^{14} 5^3 7^2 11$

□ $M_1 * M_2$ means the move M_1 **followed** by M_2 .

○ Caution: The concept is just function composition, but the notation is *different*.

○ Examples:

- $RR * UR$ is the same as $RRUR$.
- $RR * RRR$ is the same as $RRRRR = R$.

Group Properties: Verification

□ Closure

- $M_1 * M_2$ is certainly a move.

□ Identity

- e means doing nothing.

□ Inverse

- Any basic move has an inverse, e.g., $R' = RRR$.
- Given any move M , which is a sequence of basic moves, simply reverse the steps in M to obtain its inverse (denoted by M')
- e.g., $(RUF)' = F' U' R'$

□ Associativity

- Let C be a configuration of the Rubik's cube.
- Define $M(C)$ as the resultant configuration after applying M to C .
- Applying $M_1 * M_2$ to C is the same as $M_2(M_1(C))$.
- We want to prove
$$(M_1 * M_2) * M_3 = M_1 * (M_2 * M_3)$$
- L.H.S. = $M_3((M_1 * M_2)(C))$
$$= M_3(M_2(M_1(C)))$$
- R.H.S. = $(M_2 * M_3)(M_1(C))$
$$= M_3(M_2(M_1(C)))$$

Classwork

- a) Is $\langle G, * \rangle$ Abelian?
- b) Can you identify a subgroup of order 4?
- c) Will the original position be reached if UL is repeated indefinitely?

Order

Theorem: Any element of a finite group has a finite order.

Proof:

- Pick an arbitrary element a .
- Consider $a, a^2, a^3, a^4, \dots, a^m, \dots, a^n$.
- Since the group is finite, the elements must repeat.
- Let a^n be the first repeated element in the above list and $a^m = a^n$.
- Then $a^{n-m} = e$.
- The order of a is $n - m$, which is finite. *Q.E.D.*

Order of Elements in G

Examples:

□ $\text{ord}(RUR'U') = ?$ (try it yourself!)

□ $\text{ord}(UL) = 63$

□ $\text{ord}(RU^2D'BD') = 1260$ (the largest order)
