
CS3402 Database Systems:

ER , Relational Data Model

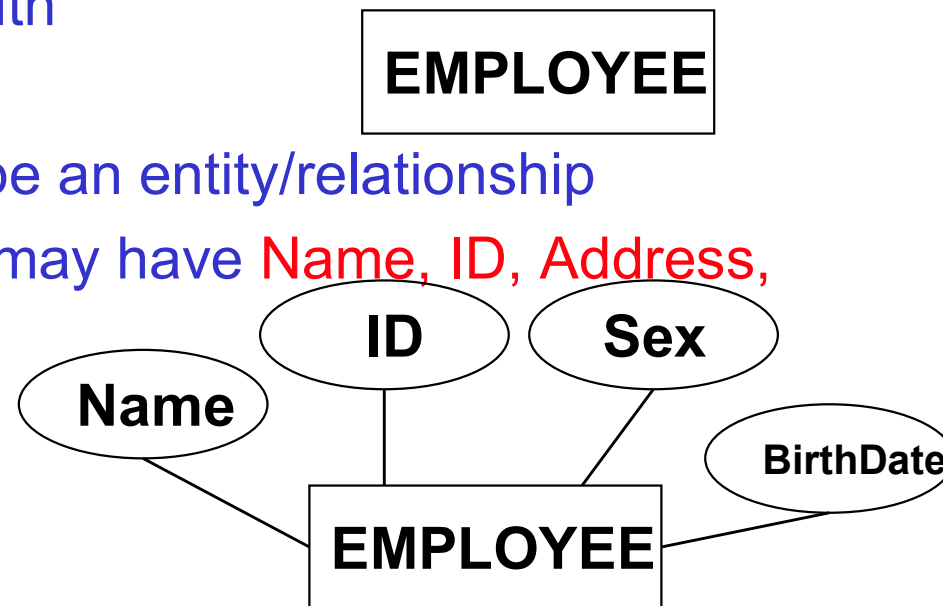

ER Model Concepts Revisited

- **Entity:** an object represented in the database

For example, an employee 'John Smith'

- **Attribute:** properties used to describe an entity/relationship

For example, an EMPLOYEE entity may have **Name**, **ID**, **Address**, **Sex**, **BirthDate**

- **Relationship:** an association among several entities

For example, EMPLOYEE John Smith **works** on the PROJECT 'X'

ER Model Concepts Revisited

-Constraints of Relationship

- **Cardinality ratio** (of a binary relationship): 1:1, 1:N, N:1, or M:N

Specify the maximum no. of relationship instances that each entity can participate in

1:1

1:N

M:N

ER Model Concepts Revisited

-Constraints of Relationship

- Two ways to indicate **Cardinality ratio** in ER Diagram

1 Place appropriate number on the link.

2 Place arrow on the 1 side

ER Model Concepts Revisited

-Constraints of Relationship

- **Participation constraint** (on each participating entity type):
 - ◆ Specify the minimum no. of relationship instances that each entity can participate in
 - ◆ Total (existence dependency) or partial
 - ◆ Total shown by **double line**, partial by **single line**
 - ◆ E.g., double line: Department to Employee; single line: Employee to Department (not all employees manage department)

(Alternative (min, max) notation for relationship structural constraints:

- Specified on *each participation* of an entity type E in a relationship type R
- Specifies that each entity e in E participates in *at least min* and *at most max* relationship instances in R
- Default (no constraint): min=0, max=n
- Must have $\text{min} \leq \text{max}$, $\text{min} \geq 0$, $\text{max} \geq 1$

Alternative (min, max) notation for relationship structural constraints:

■ Examples:

- ◆ A department has exactly one manager and an employee can manage at most one department
 - ◆ Specify (0,1) for participation of EMPLOYEE in MANAGES
 - ◆ Specify (1,1) for participation of DEPARTMENT in MANAGES

- ◆ An employee can work for exactly one department but a department can have any number (>1) of employees
 - ◆ Specify (1,1) for participation of EMPLOYEE in WORKS_FOR
 - ◆ Specify (1,n) for participation of DEPARTMENT in WORKS_FOR

The (min,max) notation for relationship constraints

One Employee may manage one Dept at most, zero Dept at least

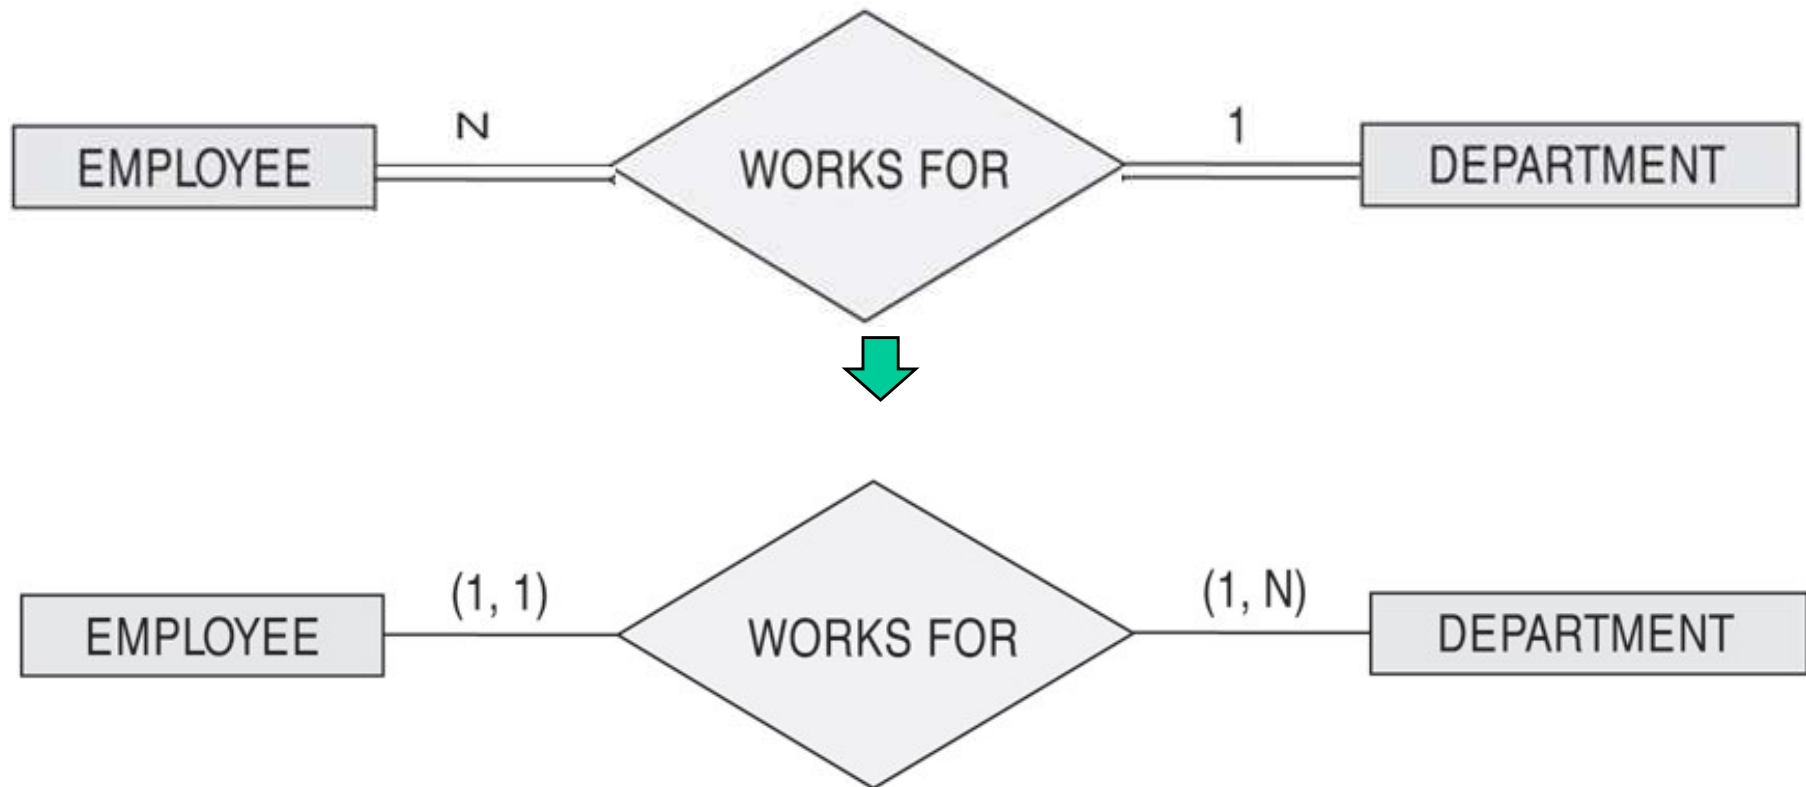

One Dept is managed by exactly one Employee

The (min,max) notation for relationship constraints

One Employee works for just one Dept

One Dept is worked by many employees, no Dept without Employee

COMPANY ER Schema Diagram using Cardinality ratio notation

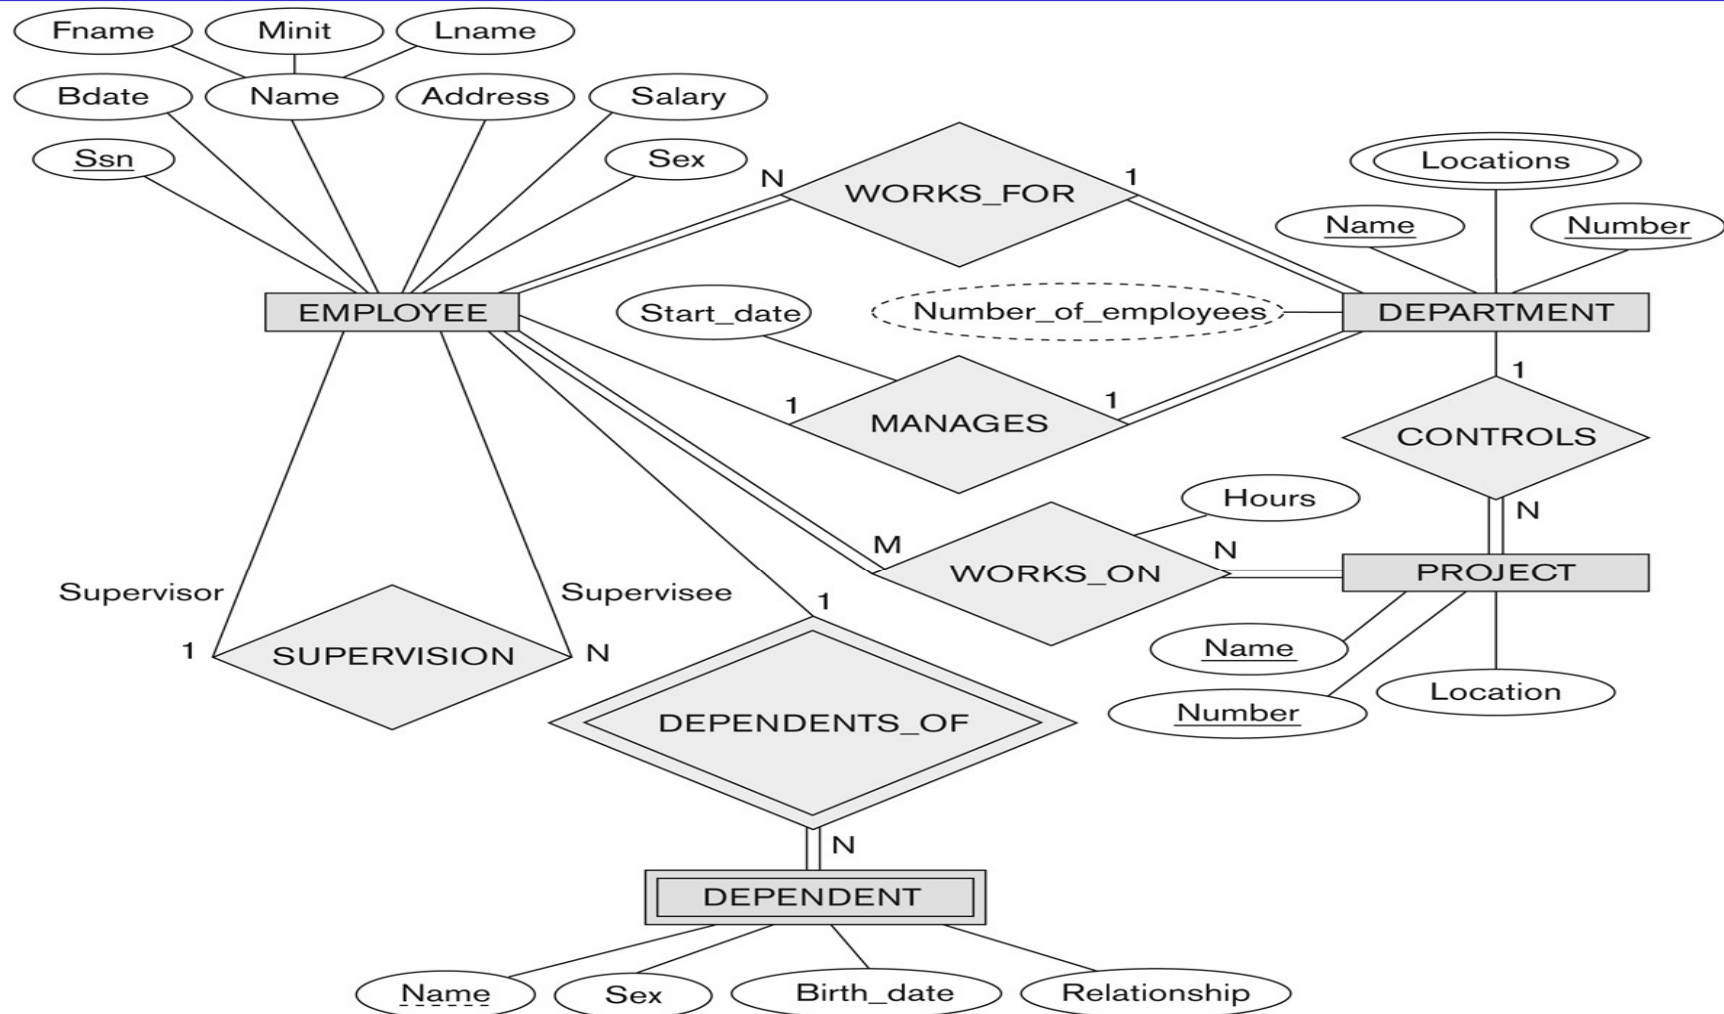

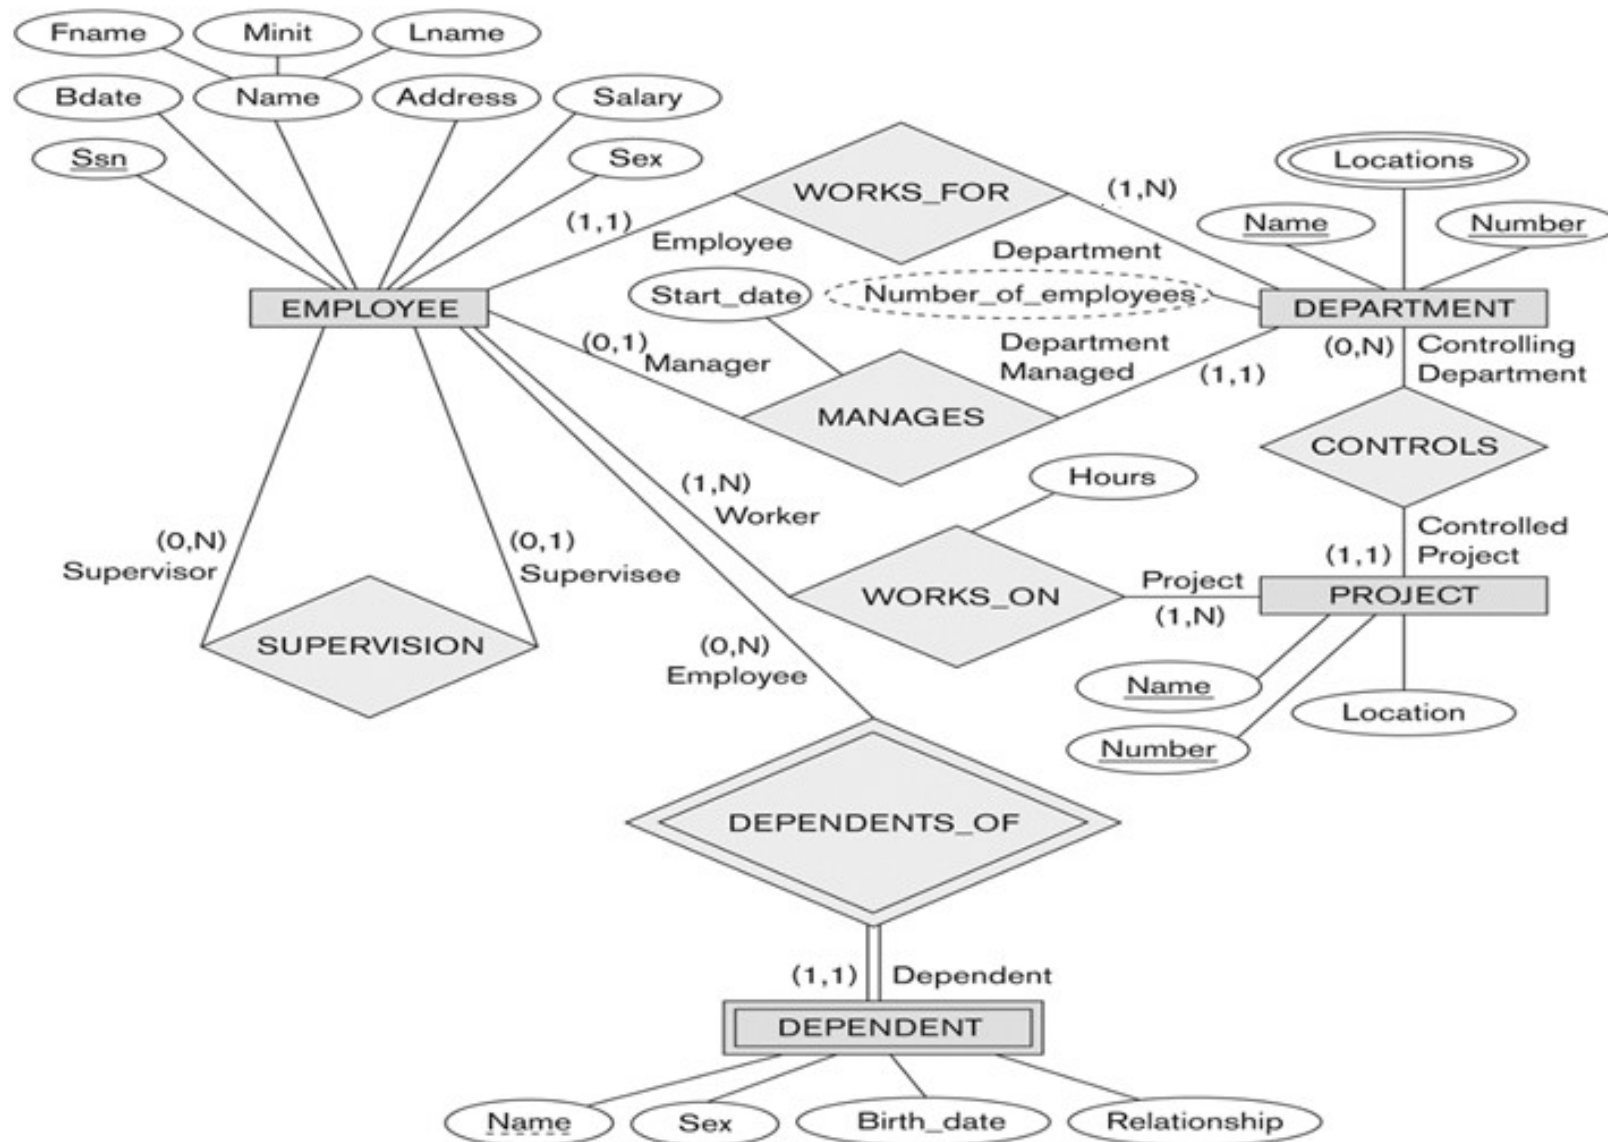

Figure 3.2

An ER schema diagram for the COMPANY database. The diagrammatic notation is introduced gradually throughout this chapter.

COMPANY ER Schema Diagram using (min, max) notation

ER Model Concepts Revisited

-Constraints of Relationship

- The **degree** of a relationship type is the number of participating entity sets.

Both MANAGES and WORKS_ON are **binary** relationships.

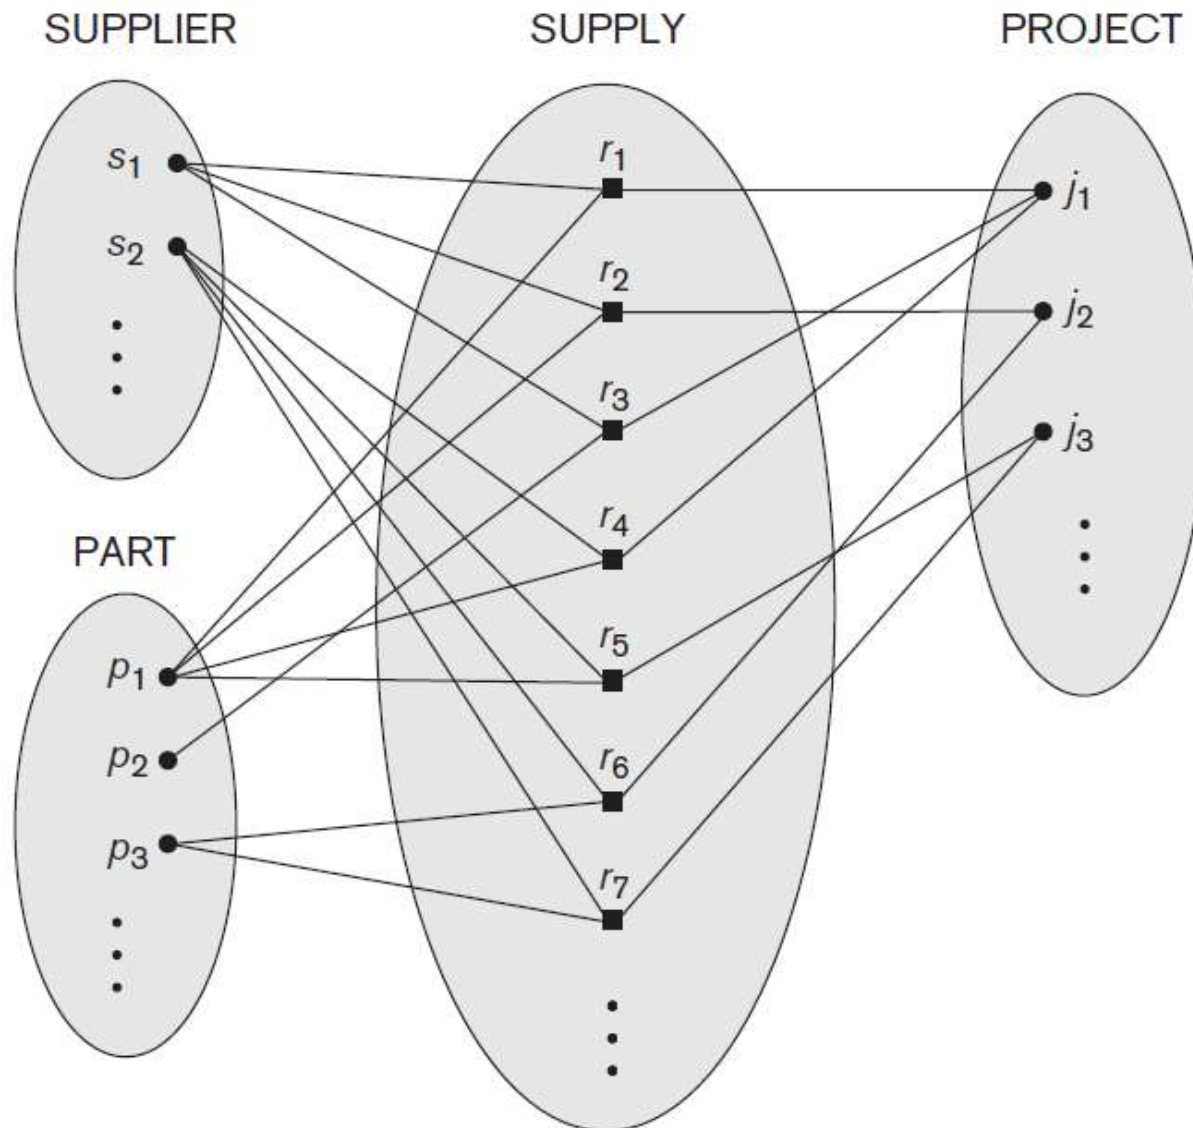

- More than one relationship type can exist with the same participating entity types

For examples, MANAGES and WORKS_FOR are distinct relationships between EMPLOYEE and DEPARTMENT.

Relationships of Higher Degree

- Relationship types of degree 2 are called **binary**
- Relationship types of degree 3 are called **ternary** and of degree n are called n -ary
 - ◆ Supplier A supplies part B for project C
- In general, an **n -ary** relationship is not equivalent to n **binary** relationships
- **Constraints** are harder to specify for higher-degree relationships ($n > 2$) than for binary relationships

Ternary Relationship: Instance Diagram

Constraints on Higher Order Relationship Types

What does it mean to put 1:n:m on the three arms of the relationship?

Constraints on Higher Order Relationship Types

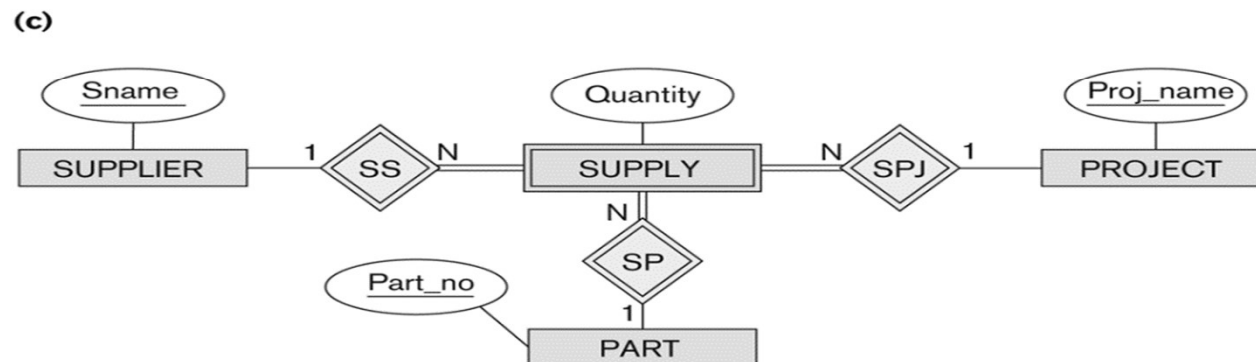

An n -ary relationship is not equivalent to n binary relationships

(S1, P1, Pj1)

(S1, P1)
(S1, Pj1)
(P1, Pj1)

(S1, Sp1)
(Sp1, Pj1)
(Sp1, P1)

Figure 3.17

Ternary relationship types. (a) The SUPPLY relationship. (b) Three binary relationships not equivalent to SUPPLY. (c) SUPPLY represented as a weak entity type.

Recursive Relationship

- A relationship type between the same participating entity type in distinct roles (roles in relationships)
- Also called a self-referencing relationship type
- Example: the SUPERVISION relationship
- EMPLOYEE participates twice in two distinct roles:
 - ◆ supervisor (or boss) role
 - ◆ supervisee (or subordinate) role
- Each relationship instance relates two distinct EMPLOYEE entities:
 - ◆ One employee in *supervisor* role
 - ◆ One employee in *supervisee* role

A Recursive Relationship Example

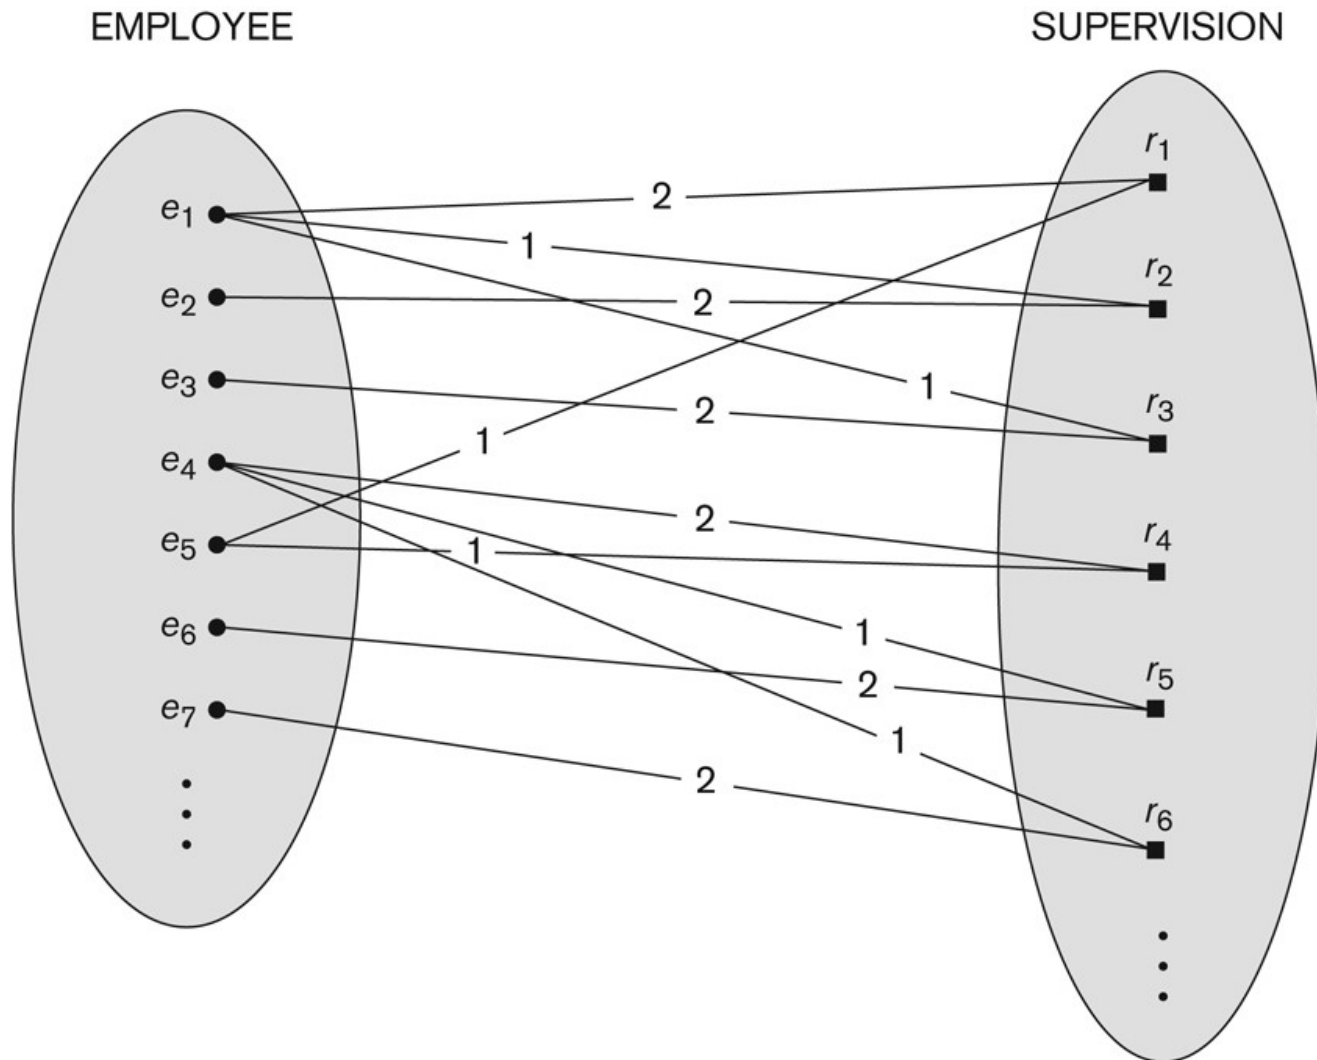

Figure 3.11
A recursive relationship SUPERVISION between EMPLOYEE in the *supervisor* role (1) and EMPLOYEE in the *subordinate* role (2).

Recursive Relationship: SUPERVISION (participation role names are shown)

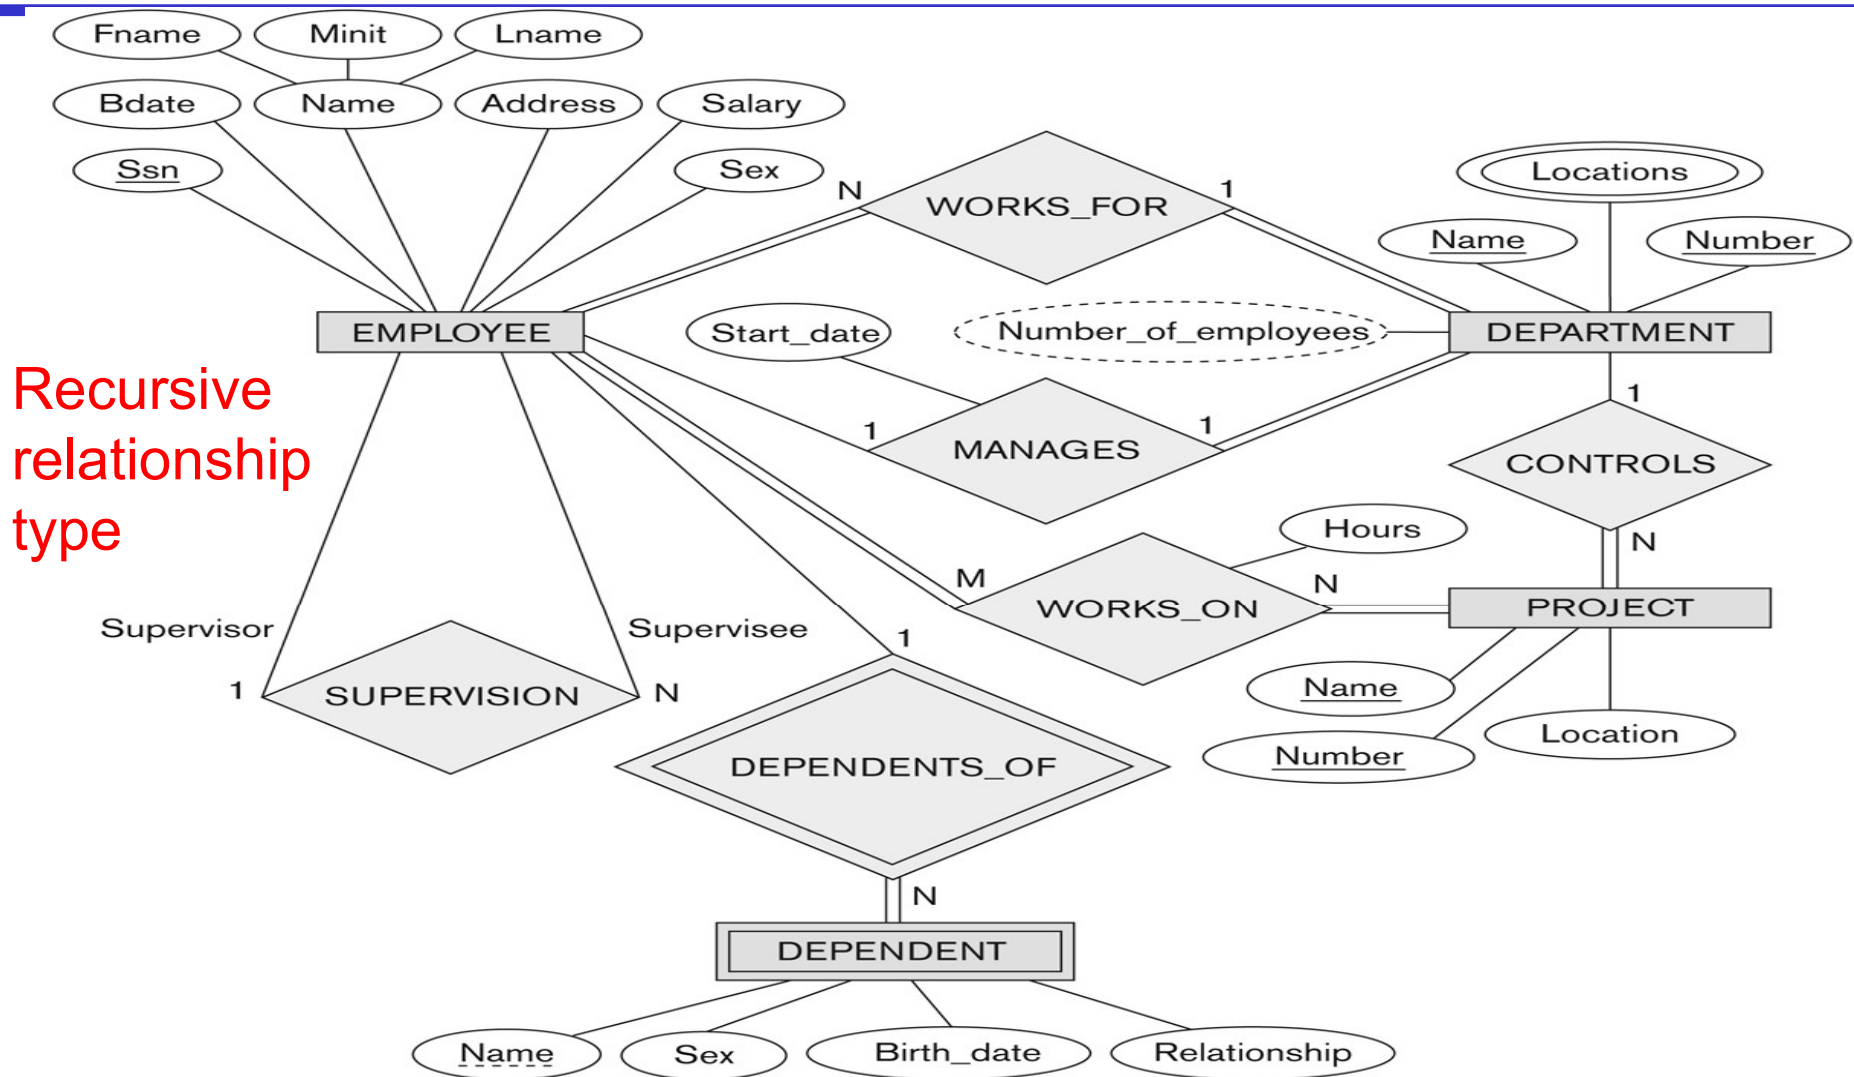

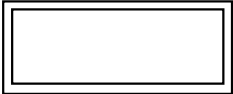

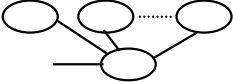

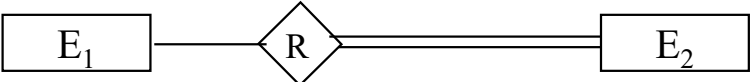

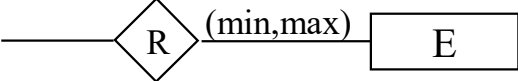

Figure 3.2

An ER schema diagram for the COMPANY database. The diagrammatic notation is introduced gradually throughout this chapter.

Summary of ER-Diagram Notation

Symbol	Meaning
	ENTITY TYPE
	WEAK ENTITY TYPE
	RELATIONSHIP TYPE
	IDENTIFYING RELATIONSHIP TYPE
	ATTRIBUTE
	KEY ATTRIBUTE
	MULTIVALUED ATTRIBUTE
	COMPOSITE ATTRIBUTE
	DERIVED ATTRIBUTE
	TOTAL PARTICIPATION OF E ₂ IN R
	CARDINALITY RATIO 1:N FOR E ₁ :E ₂ IN R
	STRUCTURAL CONSTRAINT (min, max) ON PARTICIPATION OF E IN R

Database Modelling and Implementation

Relational Model

- Although the E/R approach is a simple and an appropriate way to describe the structure of data, many database implementations are always based on another approach called the relational model
 - ◆ E/R diagram -> relation model
- The relational model was first proposed by Dr. E.F. Codd of IBM Research in 1970 in the following paper:
 - ◆ "A Relational Model for Large Shared Data Banks," Communications of the ACM, June 1970
- The above paper caused a major revolution in the field of database management and earned Dr. Codd the coveted ACM Turing Award

Informal Description

- The relational model consists of a set of **connected relations**.
- A **relation** looks like a **table** (rows x columns) of values
- A relation contains a **set of rows (tuples)** and each **column (attribute)** has a column header that gives an indication of the **meaning** of the data items in that column
 - ◆ Associated with each attribute of a relation is a set of values (**domain**)
 - ◆ Movies(title:string, year:integer, length:integer)
- The data elements in each **row (tuple)** represent certain **facts** that correspond to a real-world **entity or relationship**

Example of a Relation

Figure 5.1

The attributes and tuples of a relation STUDENT.

STUDENT(Name:string, Ssn: integer, Home_phone: integer, Address:string, ...)

Populated Relation State

- Each *relation* has many records/tuples in its current relation state/instance
- Whenever the database is changed, a new state arises
- Basic operations for changing the database:
 - ◆ **INSERT** a new tuple in a relation
 - ◆ **DELETE** an existing tuple from a relation
 - ◆ **MODIFY** an attribute value of an existing tuple

Populated database state for COMPANY

Figure 5.6

One possible database state for the COMPANY relational database schema.

EMPLOYEE

Fname	Minit	Lname	Ssn	Bdate	Address	Sex	Salary	Super_ssn	Dno

Definition Summary

<u>Informal Terms</u>	<u>Formal Terms</u>
Table	Relation
Column Header	Attribute
All possible Column Values	Domain
Row	Tuple
Table Definition	Schema of a Relation
Populated Table	State of the Relation

Characteristics Of Relations

- Ordering of tuples in a relation:
 - ◆ The tuples *are not considered to be ordered*, even though they appear to be in a tabular form (may have different *presentation* orders)
- Ordering of attributes in a relation schema R (and of values within each tuple):
 - ◆ We consider the attributes in $R(A_1, A_2, \dots, A_n)$ and the values in $t = \langle v_1, v_2, \dots, v_n \rangle$ to *be ordered*

Same state with different order of tuples

Figure 5.2

The relation STUDENT from Figure 5.1 with a different order of tuples.

STUDENT

Name	Ssn	Home_phone	Address	Office_phone	Age	Gpa
Dick Davidson	422-11-2320	NULL	3452 Elgin Road	749-1253	25	3.53
Barbara Benson	533-69-1238	839-8461	7384 Fontana Lane	NULL	19	3.25
Rohan Panchal	489-22-1100	376-9821	265 Lark Lane	749-6492	28	3.93
Chung-cha Kim	381-62-1245	375-4409	125 Kirby Road	NULL	18	2.89
Benjamin Bayer	305-61-2435	373-1616	2918 Bluebonnet Lane	NULL	19	3.21

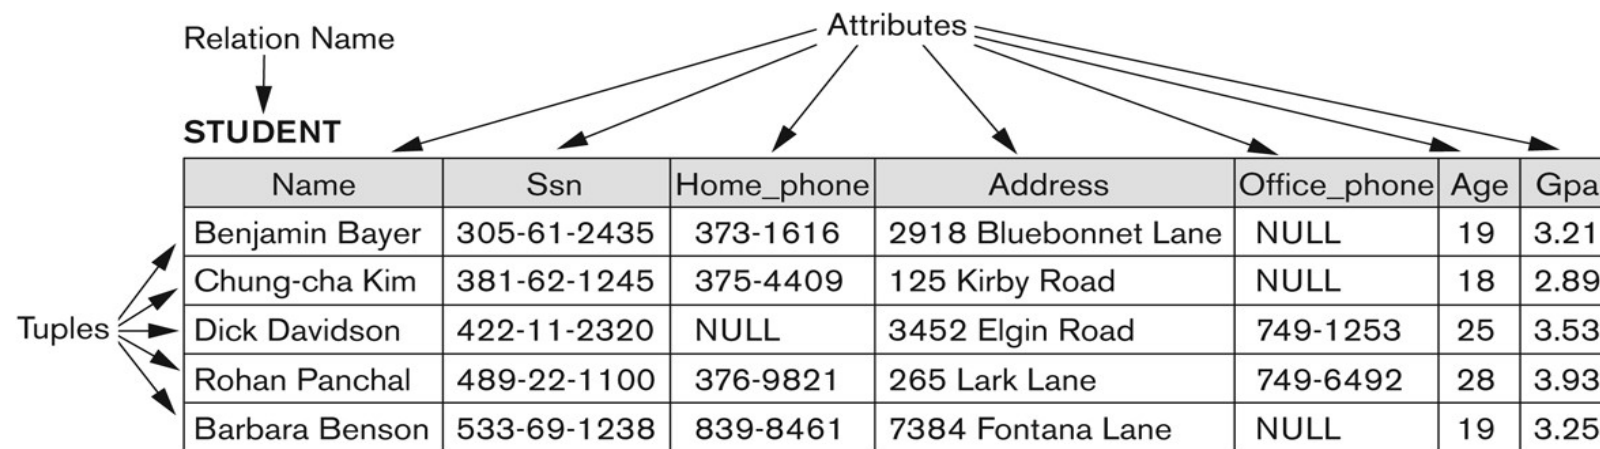

Figure 5.1

The attributes and tuples of a relation STUDENT.

Characteristics Of Relations

- Values in a tuple:
 - ◆ All values are considered **atomic** (indivisible)
 - ◆ Basic unit for manipulation (add or change)
 - ◆ Each value must be from the **domain (set of values)** of the attribute for that column
 - ◆ A special **null** value is used to represent values that are unknown or not available or inapplicable in certain tuples
- We refer to the attribute **values** of a tuple t by:
 - ◆ $t[A_i]$ or $t.A_i$: the value v_i of attribute A_i for tuple t

From E/R Diagrams to Relations

- Converting an E/R design to a relational schema (an approximation approach):
 - ◆ Turn each **entity set** into a relation with the same set of attributes
 - ◆ Replace a **relationship** by a relation or attributes of the connected entity set.

Example: ER of Company

Figure 3.2

An ER schema diagram for the COMPANY database. The diagrammatic notation is introduced gradually throughout this chapter.

EMPLOYEE

Fname	Minit	Lname	<u>Ssn</u>	Bdate	Address	Sex	Salary	Super_ssn	Dno
-------	-------	-------	------------	-------	---------	-----	--------	-----------	-----

DEPARTMENT

Dname	<u>Dnumber</u>	Mgr_ssn	Mgr_start_date
-------	----------------	---------	----------------

DEPT_LOCATIONS

<u>Dnumber</u>	<u>Dlocation</u>
----------------	------------------

PROJECT

Pname	<u>Pnumber</u>	Plocation	Dnum

<u>Essn</u>	<u>Dependent_name</u>	Sex	Bdate	Relationship
-------------	-----------------------	-----	-------	--------------

Figure 9.2

Result of mapping the COMPANY ER schema into a relational database schema.

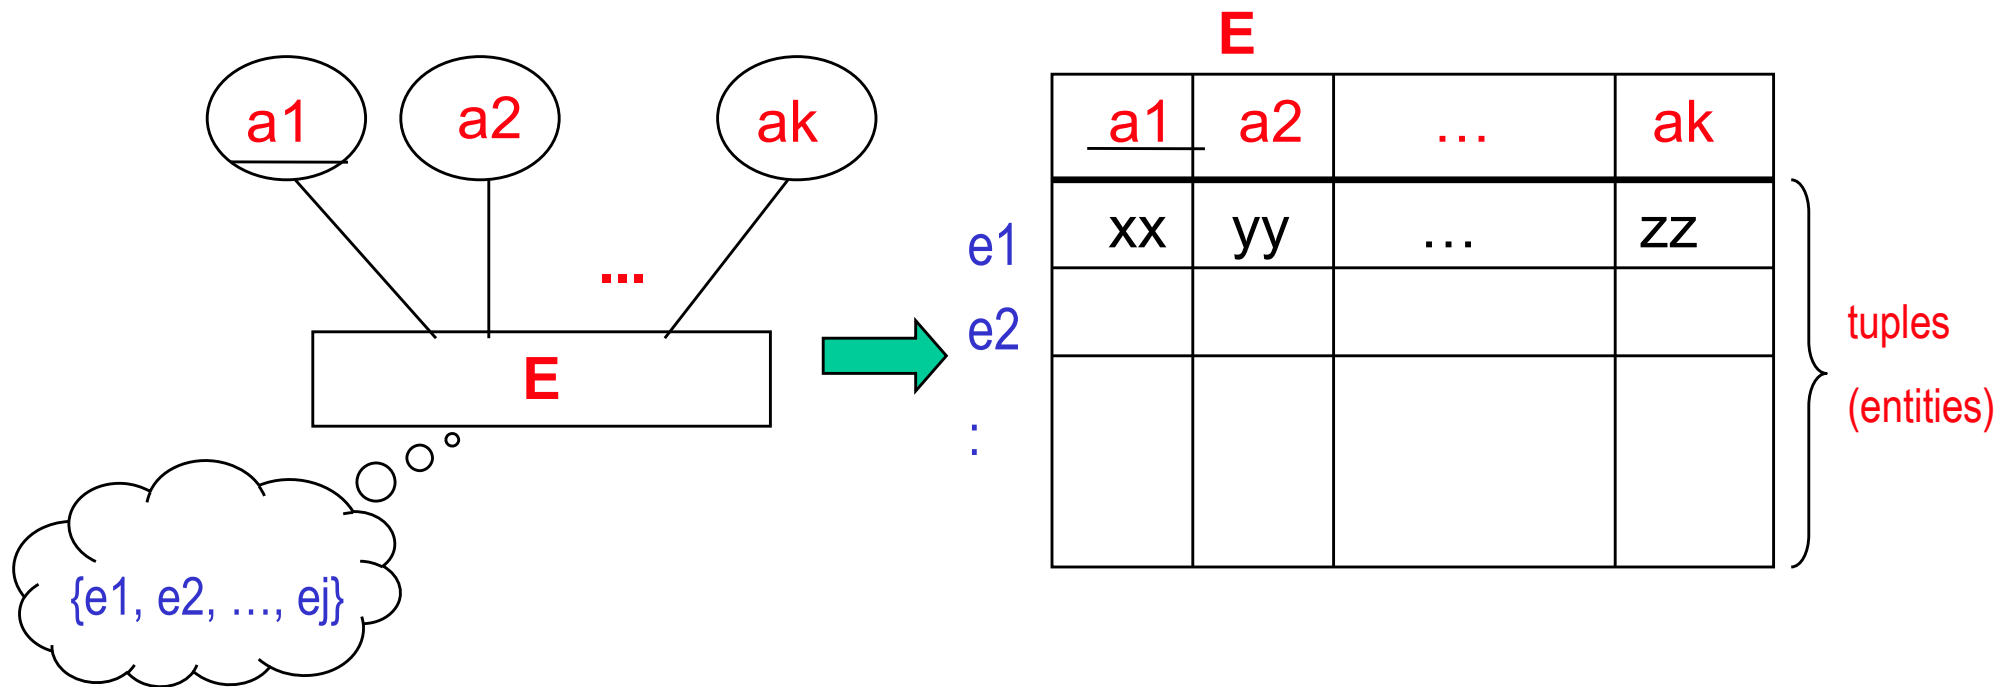

ER-to-Relational Mapping Algorithm

- COMPANY database example
 - ◆ Assume that the mapping will create tables with simple single-valued attributes
- **Step 1: Mapping of Regular (strong) Entity Types**
 - ◆ For each regular entity type E , create a relation E that includes all the simple attributes and all simple component of a composite attribute of E
 - ◆ Choose one of the key attributes E as the primary key for E
 - ◆ Called entity relations
 - Each tuple represents an entity instance

ER to Relations (Entity Sets)

- Mapping ER Diagrams into tables (relations)

◆ Representation of (Strong) Entity Sets

ER-to-Relational Mapping Algorithm

After Step1:

EMPLOYEE

Fname	Minit	Lname	<u>Ssn</u>	Bdate	Address	Sex	Salary
-------	-------	-------	------------	-------	---------	-----	--------

DEPARTMENT

Dname	<u>Dnumber</u>
-------	----------------

PROJECT

Pname	<u>Pnumber</u>	Plocation
-------	----------------	-----------

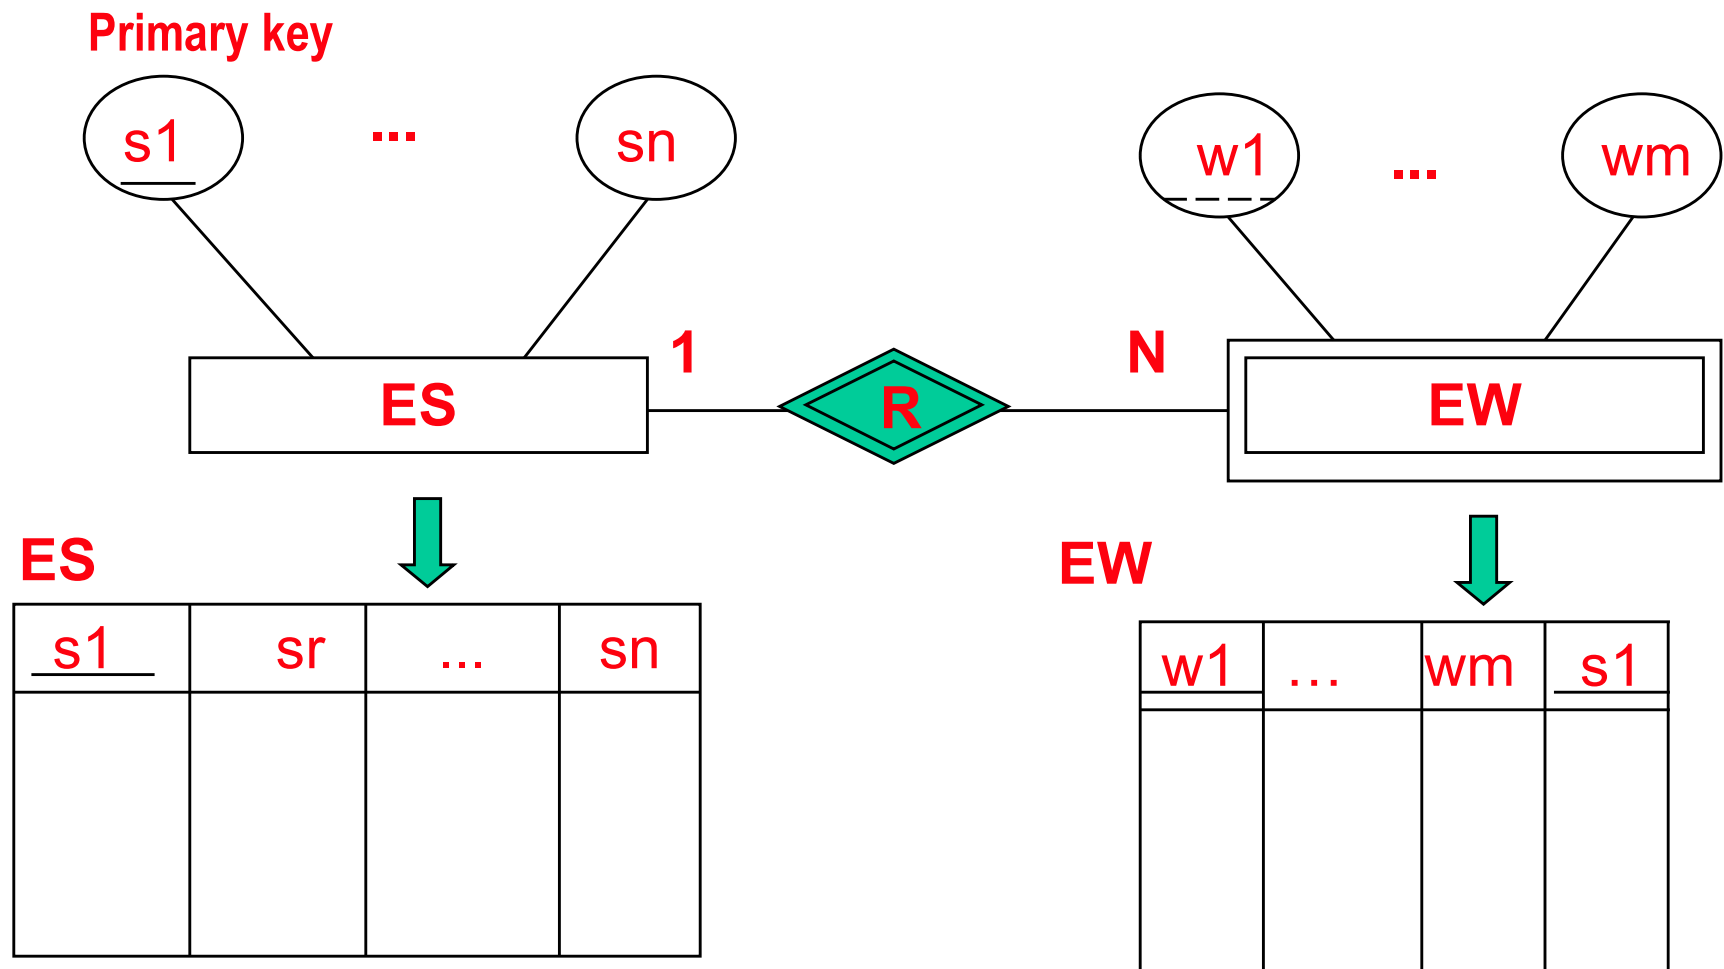

ER-to-Relational Mapping Algorithm

■ **Step 2: Mapping of Weak Entity Types**

- ◆ For each weak entity type E , create a relation E and include all simple attributes and simple component of the entity type as attributes of the relation.
- ◆ Include primary key attribute of owner as foreign key attributes of E
- ◆ The primary key of E is the combination of the foreign key and the partial key of the weak entity type
- ◆ E.g., Essn and Dependent_Name

ER to Relations (Weak Entity Set)

■ Representation of Weak Entity Sets

ER-to-Relational Mapping Algorithm

After Step2:

EMPLOYEE

Fname	Minit	Lname	<u>Ssn</u>	Bdate	Address	Sex	Salary
-------	-------	-------	------------	-------	---------	-----	--------

DEPARTMENT

Dname	<u>Dnumber</u>
-------	----------------

PROJECT

Pname	<u>Pnumber</u>	Plocation
-------	----------------	-----------

DEPENDENT

<u>Essn</u>	<u>Dependent_name</u>	Sex	Bdate	Relationship
-------------	-----------------------	-----	-------	--------------

ER-to-Relational Mapping Algorithm

- **Step 3: Mapping of Binary 1:1 Relationship Types**
 - ◆ For each binary 1:1 relationship type
 - Identify relations that correspond to entity types participating in R
 - ◆ Possible approaches:
 - Foreign key approach
 - Merged relation approach
 - Cross reference or relationship relation approach

ER-to-Relational Mapping Algorithm

■ **Foreign key approach ($S \rightarrow T$)**

- ◆ Choose one of the relations S and include the primary key of T as a foreign key in S
- ◆ Include all the simple attributes of relationship in S
- ◆ It is better to choose an entity type with total participation in the role of S. (Avoid Null value)

ER-to-Relational Mapping Algorithm

■ **Merged relation approach**

- ◆ To merge the two entity types and the relationship into a single relation
- ◆ This is possible when both participations are total.

■ **Cross reference approach**

- ◆ Set up a third relation ***R*** for the purpose of **cross-referencing** the primary keys of the two relations **S** and **T** representing the entity types
- ◆ The relation ***R*** will include the **primary key attributes** of **S** and **T** as foreign keys to **S** and **T**
- ◆ The primary key of **R** will be **one of the two foreign keys**

ER-to-Relational Mapping Algorithm

After Step3:

EMPLOYEE

Fname	Minit	Lname	<u>Ssn</u>	Bdate	Address	Sex	Salary
-------	-------	-------	------------	-------	---------	-----	--------

DEPARTMENT

Dname	<u>Dnumber</u>	Mgr_ssn	Mgr_start_date
-------	----------------	---------	----------------

PROJECT

Pname	<u>Pnumber</u>	Plocation
-------	----------------	-----------

DEPENDENT

<u>Essn</u>	<u>Dependent_name</u>	Sex	Bdate	Relationship
-------------	-----------------------	-----	-------	--------------

ER-to-Relational Mapping Algorithm

■ **Step 4: Mapping of Binary 1:N Relationship Types**

◆ **Foreign key approach ($S \rightarrow T$)**

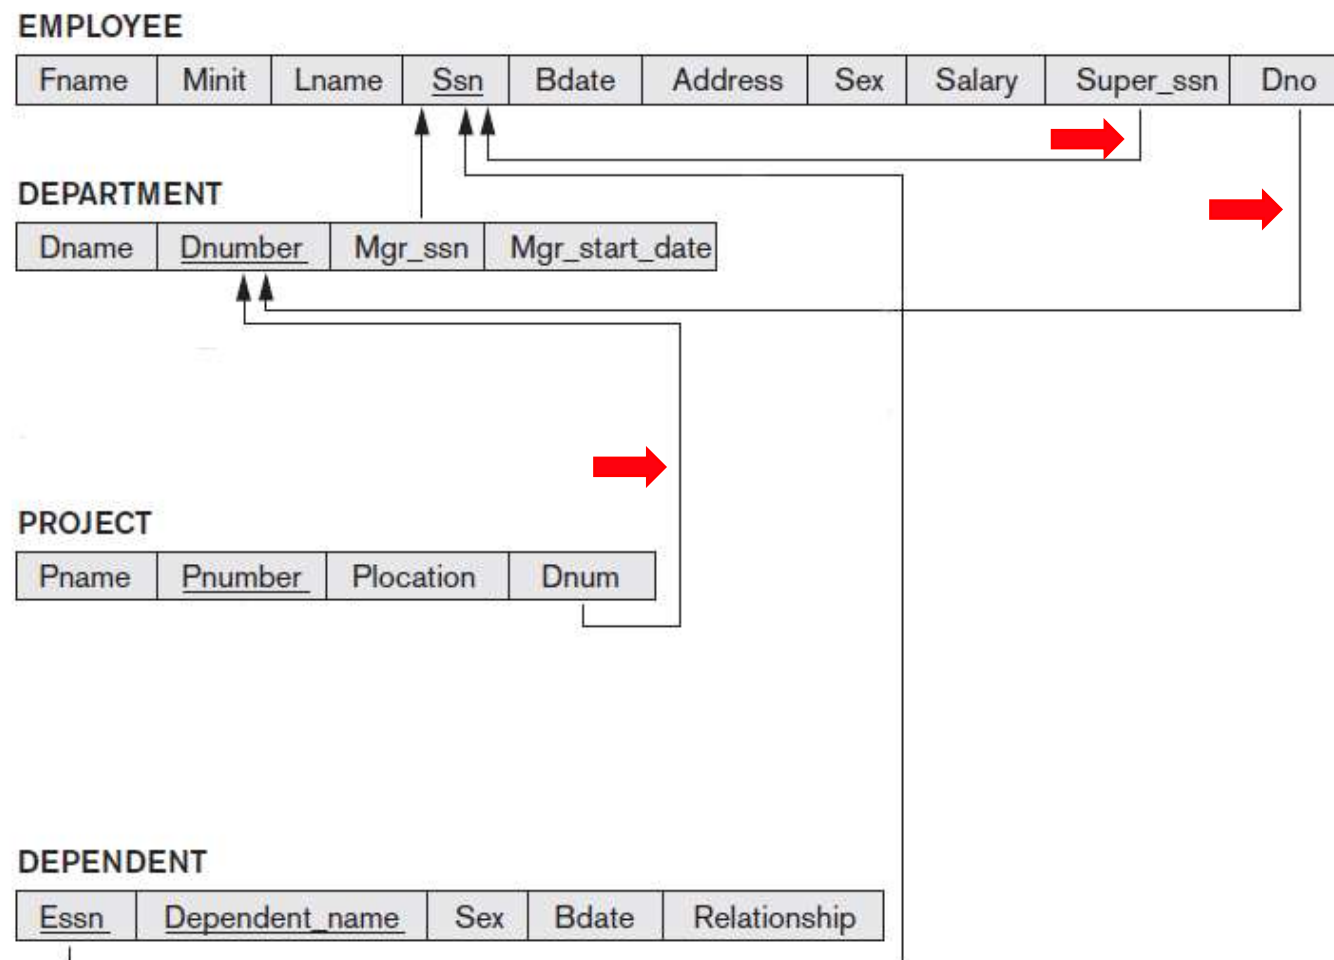

- Identify relation that represents participating entity type at *N-side* of relationship type *T*
- Include primary key of other entity type as foreign key in *T*
- Include simple attributes of 1:N relationship type as attributes of *T*

◆ **Cross-reference approach**

- as in the third option for binary 1:1 relationships

ER-to-Relational Mapping Algorithm

After Step4:

ER-to-Relational Mapping Algorithm

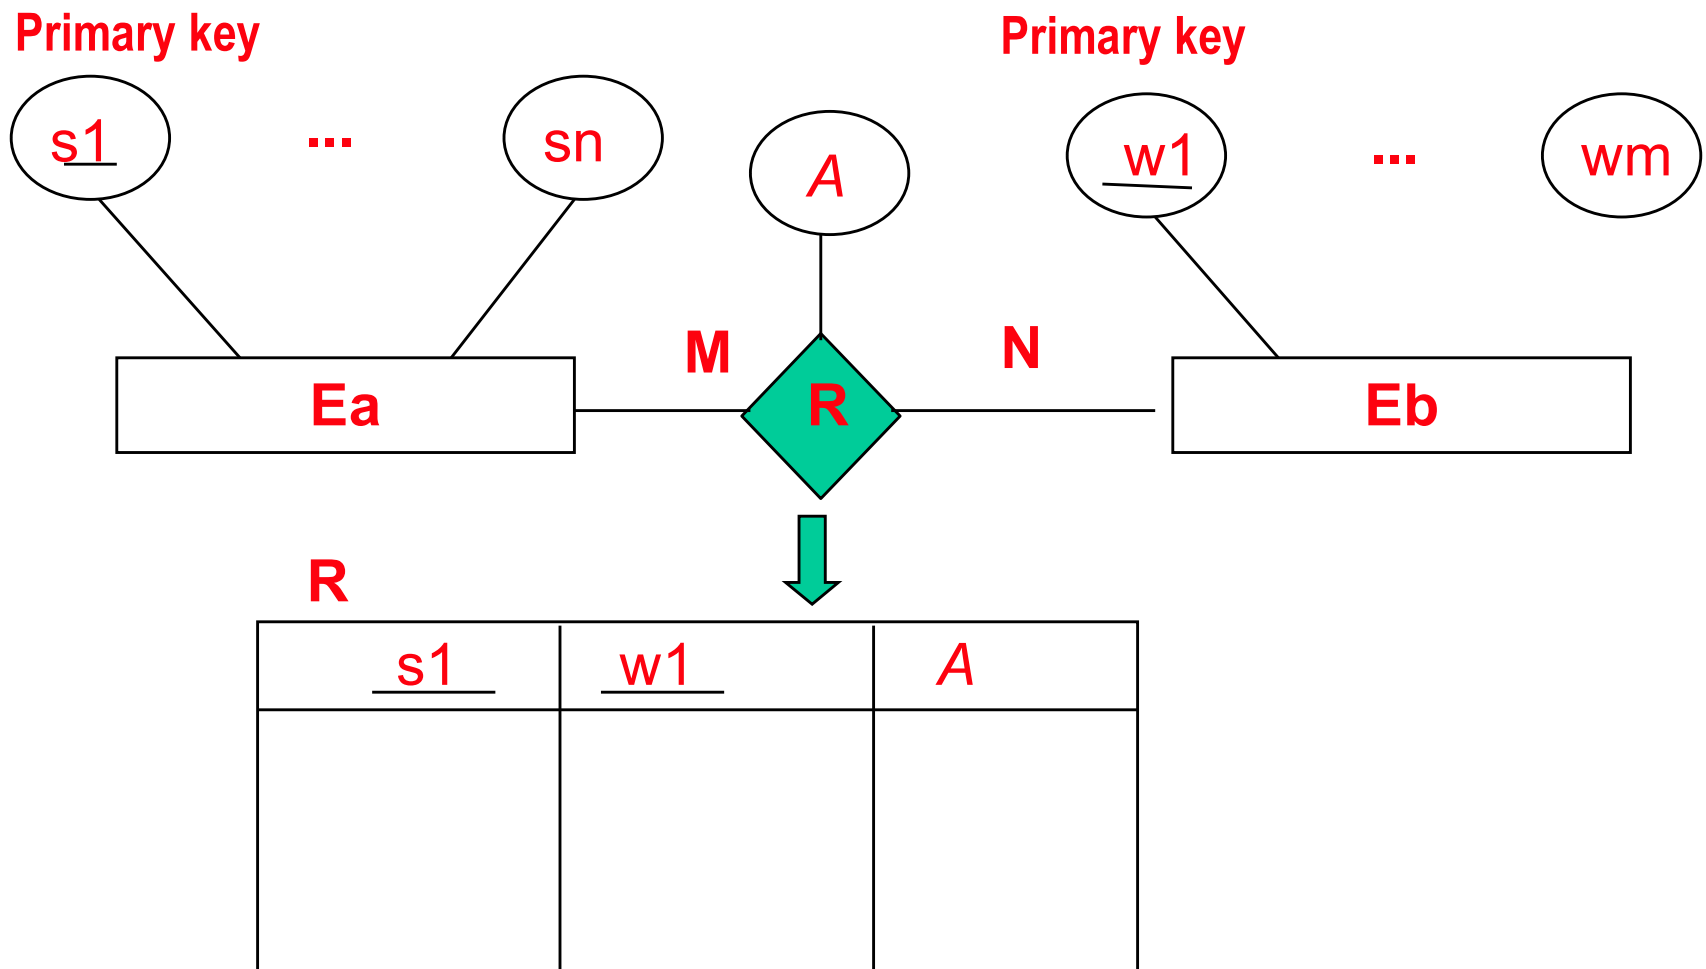

■ **Step 5: Mapping of Binary $M:N$ Relationship Types**

◆ **Cross-reference approach:**

- Create a new relation R
- Include as primary key of participating entity types as foreign key attributes in R
- Their combination forms the primary keys of the relations
- Include any simple attributes of $M:N$ relationship type

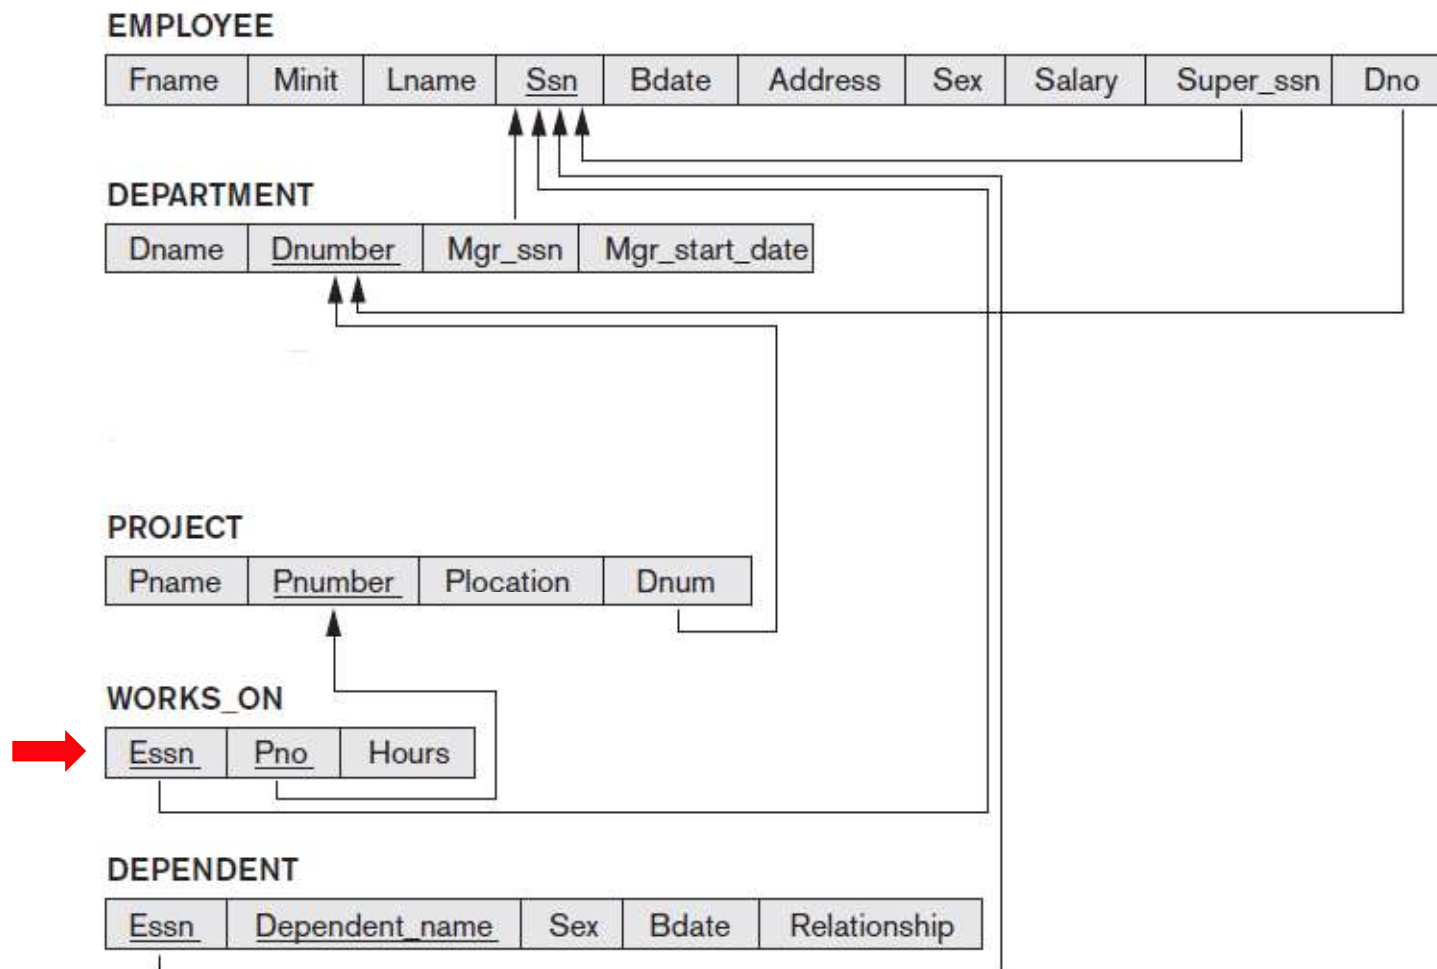

ER to Relations (Many-to-Many)

■ Representation of Many to Many Relationship Sets

ER-to-Relational Mapping Algorithm

After Step5:

ER-to-Relational Mapping Algorithm

- Step 6: Mapping of N -ary Relationship Types
 - ◆ For each n -ary relationship
 - Create a new relation **R**
 - Include **primary keys** of participating entity types as foreign keys
 - Include any simple attributes of the relationship as attributes of **R**
 - The primary key is a combination of **all foreign keys** that reference the relations representing the participating entity types

ER-to-Relational Mapping Algorithm

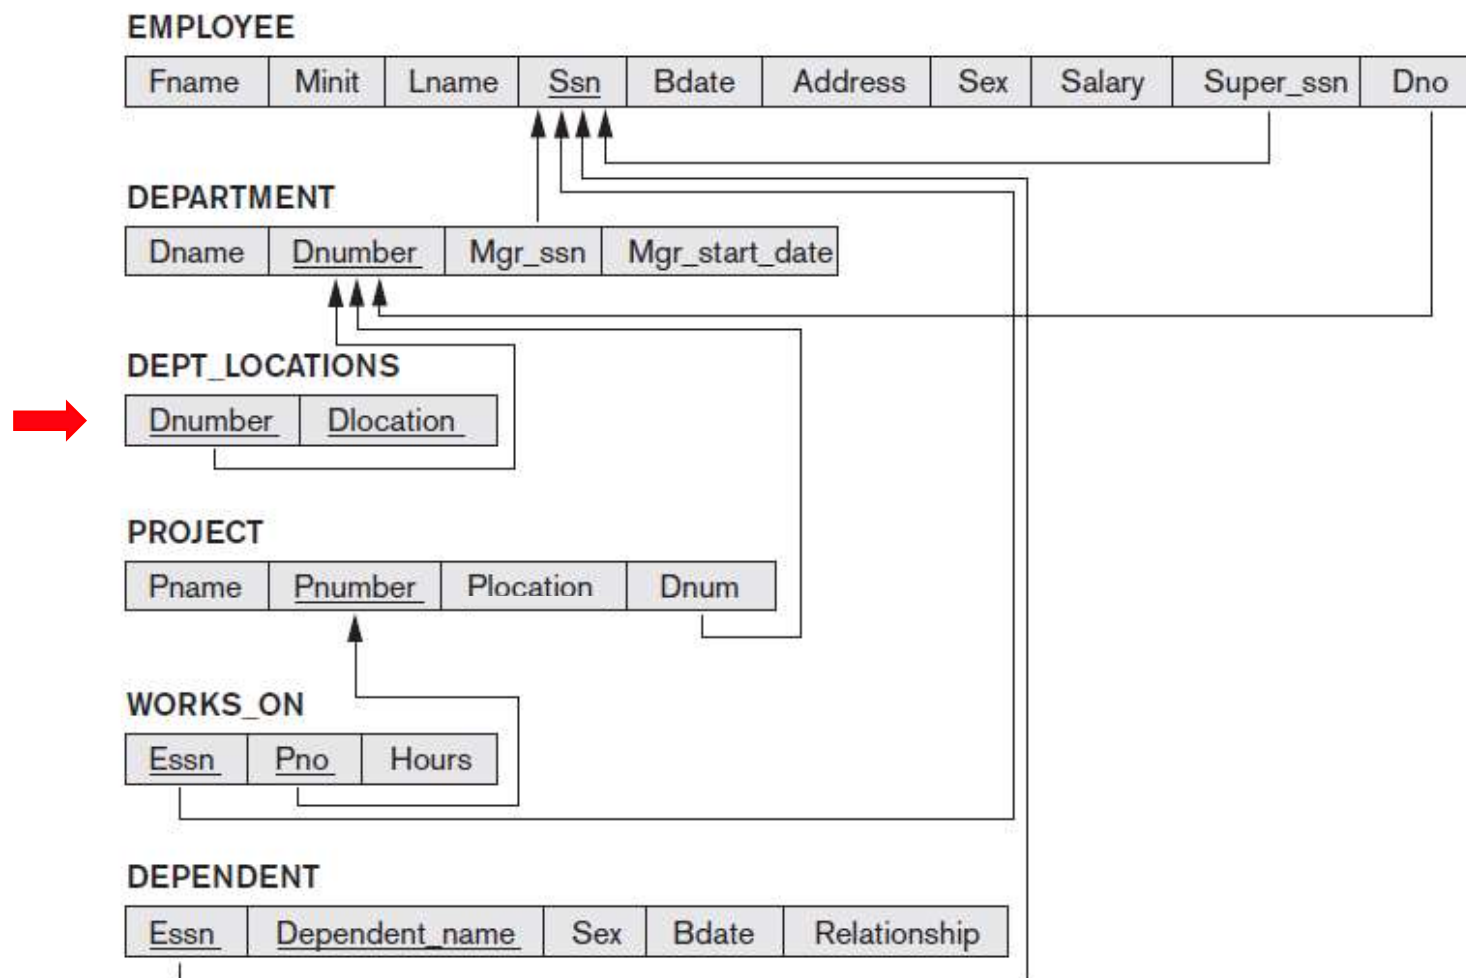

■ **Step 7: Mapping of Multivalued Attributes**

◆ For each multivalued attribute A

- Create a new relation R
- Include an attribute corresponding to A , plus the primary key attribute K —as a foreign key in R —of the relation that represents the entity type or relationship type that has A as a multivalued attribute.
- Primary key of R is the combination of A and K
- If the multivalued attribute is composite, include its simple components

ER-to-Relational Mapping Algorithm

After Step7:

Discussion and Summary of Mapping for ER Model Constructs

Table 9.1 Correspondence between ER and Relational Models

ER MODEL	RELATIONAL MODEL
Entity type	<i>Entity</i> relation
1:1 or 1:N relationship type	Foreign key (or <i>relationship</i> relation)
M:N relationship type	<i>Relationship</i> relation and <i>two</i> foreign keys
<i>n</i> -ary relationship type	<i>Relationship</i> relation and <i>n</i> foreign keys
Simple attribute	Attribute
Composite attribute	Set of simple component attributes
Multivalued attribute	Relation and foreign key
Value set	Domain
Key attribute	Primary (or secondary) key
