# Answer for Test 1 of EE3315 2022-2023 Semester B

**Question 1**. Consider the following network:                                    **[20 marks]**

The number on each link represents the cost of using this link. Using Dijkstra's algorithm, compute the shortest path from **Node E** to all network nodes. If there is a tie, ***break it in favor of leftmost column***. List the shortest paths from Node E to all the other nodes and specify their costs.

| N | A | B | C | D | F | G | H |
|---|---|---|---|---|---|---|---|
| E | ∞ | ∞ | 3, E | 3, E | 3, E | ∞ | ∞ |
| E,C | 7, C | 5, C | | 3, E | 3, E | ∞ | ∞ |
| E,C,D | 7, C | 5, C | | | 3, E | 4, D | ∞ |
| E,C,D,F | 7, C | 5, C | | | | 4, D | ∞ |
| E,C,D,F,G | 7, C | 5, C | | | | | 17, G |
| E,C,D,F,G,B | 6, B | | | | | | 7, B |
| E,C,D,F,G,B,A | | | | | | | 7, B |
| E,C,D,F,G,B,A,H | | | | | | | |

The shortest path from Node E to
A: ECBA    -  6
B: ECB     -  5
C: EC      -  3
D: ED      -  3
F: EF      -  3
G: EDG     -  4
H: ECBH    -  7

**Question 2**. In Figure Q.2, assume that link CD has gone down for a long time. Assume A, B and D use split horizon with Poisoned Reverse.                    **[26 marks]**

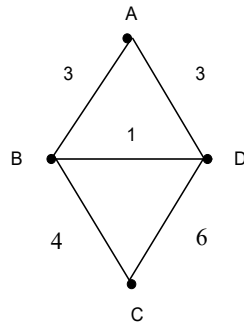

Figure Q.2

i.      What distance to C will B report to A? 4
ii.     What distance to C will B report to D? 4
iii.    What distance to C will D report to B?  ∞
iv.     What distance to C will D report to A? 5

Now, suppose link BC goes down.
v.      What is the distance to C that B reports to A? ∞
vi.     At the same time, what distance to C will D report to A?  5
vii.    At the same time, what is the distance to C that B reports to D?  ∞
viii.   At the same time, what is the distance to C that A reports to D? 7
ix.     What does A then think the shortest path to C is? A-D-B-C
x.      What does A then tell D about its distance to C?  ∞
xi.     What does A then tell B about its distance to C?  8
xii.    What is B's route to C now? B-A-D-B-C
xiii.   What does B then tell D the distance to C? 11

**Question 3.** Figure Q3 shows a network using Hierarchical Routing. Draw down the topology of the network from Node 2D's point of view under the use of Hierarchical Routing. Write down the routing table for node 2D under Hierarchical Routing. Note that for each destination, "next hop" and "number of hops" (to that destination) should be included. **[18 marks]**

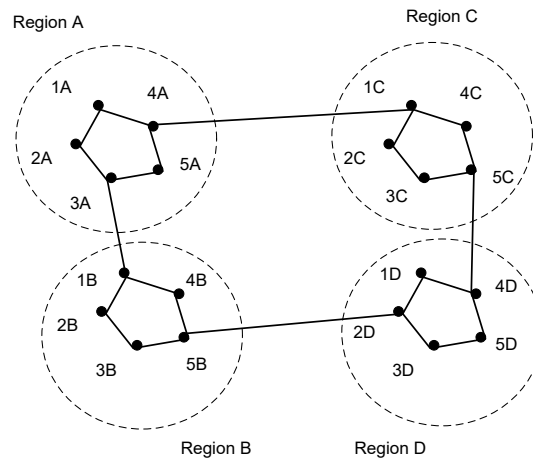

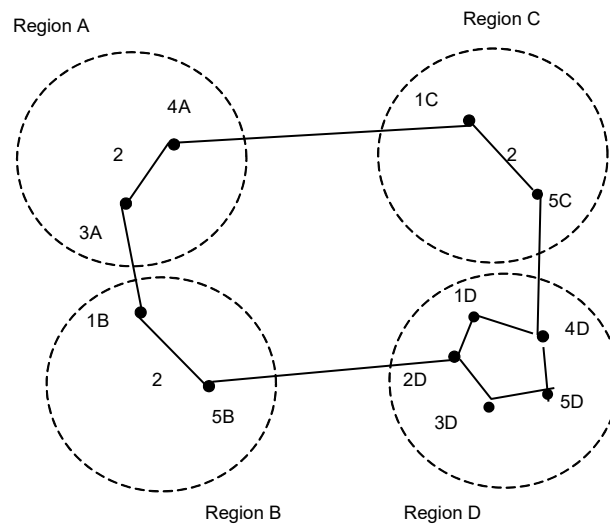

Figure Q3

Routing table for 2D

| Destination | Next Hop | No. of Hops |
|---|---|---|
| 2D | - | - |
| 1D | 1D | 1 |
| 3D | 3D | 1 |
| 4D | 1D | 2 |
| 5D | 3D | 2 |
| A | 5B | 4 |
| B | 5B | 1 |
| C | 1D | 3 |

**Question 4.**                                                                                   **[16 marks]**

Initially, we have the following distance vectors for the network in Figure Q4

       Distance vector of x: (0, 11, 5)

       Distance vector of z: (5, 6, 0)

Now link cost of y-z changes from 6 to 40. Using Distance Vector routing algorithm, write down the steps showing that node x and node z update their distance vectors until the routing algorithm converges.

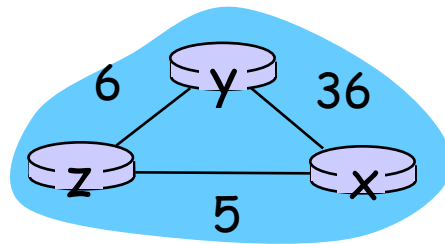

Figure Q.4

Answer for Question 4:

1. z updates its vector:
     Dist. vector z: (5, 16, 0)
2. x updates its vector:
     Dist. vector x: (0, 21, 5)
3. z updates its vector:
     Dist. vector z: (5, 26, 0)
4. x updates its vector:
     Dist. vector x: (0, 31, 5)
5. z updates its vector:
     Dist. vector z: (5, 36, 0)
6. x updates its vector:
     Dist. vector x: (0, 36, 5)
7. z updates its vector:
     Dist. vector z: (5, 40, 0)
8. x updates its vector:
     Dist. vector x: (0, 36, 5)

## Question 5. [8 marks]

In Figure Q.5, we assume that A, B, C are provider networks and X, W, Y are customers of provider networks. In addition, Border Gateway Protocol (BGP) is used between networks. State whether the following statements are true or false. Explain your answer.

        i) A is not willing to advertise to C the path AY.
        ii) A is not willing to advertise to B the path AY.
        iii) B is not willing to advertise to X the path BAY.
        iv) B is not willing to advertise to C the path BAY.

Figure Q.5 : A simple BGP scenario

i) False. A gets "revenue" for routing BAY since Y is A's customer.
ii) False. A gets "revenue" for routing CAY since Y is A's customer.
iii) False. B gets "revenue" for routing XBAY since X is B's customer.
iv) True. B gets no "revenue" for routing CBAY since neither Y nor C is B's customers
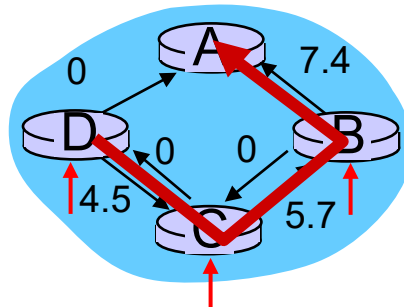

Let link cost be equal to the amount of carried traffic in a link. Let the traffic from node B, node C and node D to node A be 1.7 unit, 1.2 unit and 4.5 units, respectively. According to the routing decision initially given by the following figure, draw down three corresponding figures if we use Link State routing algorithm three times to find new shortest paths to node A resulting in new costs.

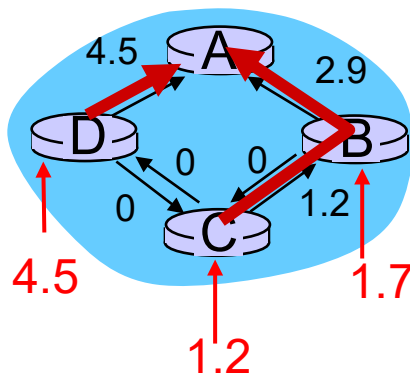

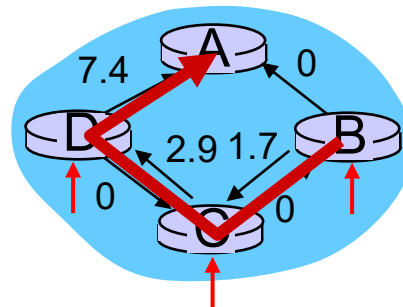

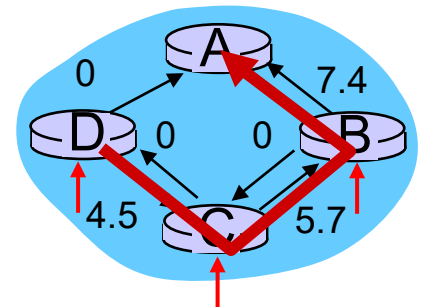

initially

Answer for Question 6:

given these costs,
find new routing….
resulting in new costs

given these costs,
find new routing….
resulting in new costs

given these costs,
find new routing….
resulting in new costs
